**Abstract:** In this work, we study the local solution to a nonlinear equation arising in meteorology, whose linearized operator is of mixed type. Precisely, it is elliptic on one side of a hypersurface and hyperbolic on its other side. The change of type makes the problem quite interesting. We first show the unique existence and a priori estimates for the solution to the equation associated with linearized operator. Then, we use Nash-Moser iterations twice to solve the nonlinear equation in elliptic and hyperbolic regions separately and then extend the solution across the hypersurface.
